Portfolio

Web Developer
PHP Programmer
And WordPress Expert

Armin Hajipour

Hi there

I'm Armin Hajipour

MY BIO

When I was a computer science student, I started accepting website design projects with ready-made themes.

Over time, I learned HTML, CSS, and JavaScript to change the appearance of sites, but back-end coding was more interesting to me.

Considering that WordPress was written in PHP language, I learned this language professionally and after that I learned WordPress theme and plugin writing to be a complete expert in my job.

It's been a while since I entered the international market and I like to help people and companies to have beautiful and efficient websites.

What I use in website development:

PHP 7

MySQL

Wordpress

HTML 5

CSS 3

JavaScript

The services I provide:

Increase website speed

Increase website security

theme writing,
Plugin writing and
specialized coding
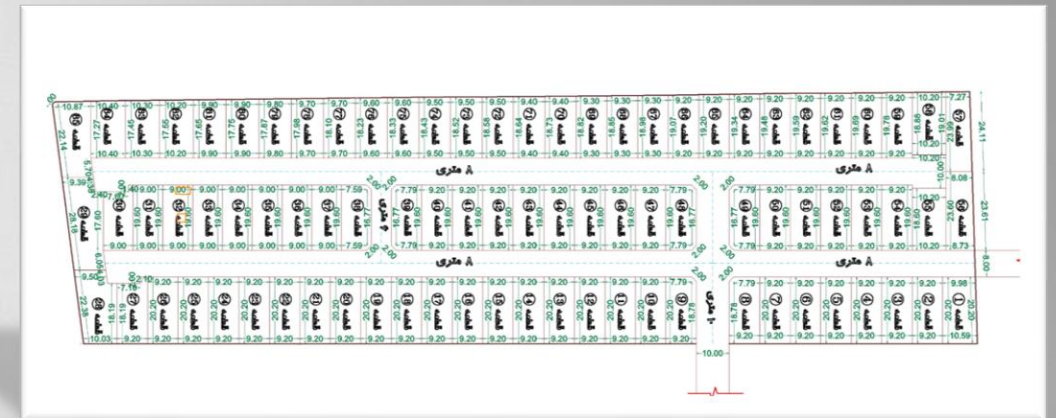

Some of my portfolios on the following pages

1. Plot of lands selection by members of a private company:

I designed this site at the request of a company called Azad University Housing Cooperative.

This company in a project received capital from prestigious professors of the university And bought a large piece of land for them and divided it into smaller pieces and obtained a title deed for each of them.

In this program, members who deposited money earlier had more priority in choosing land and could choose earlier than others.

Also, a beautiful graphic interface should have been designed for this program so that users can identify the reserved parts with a simple glance.

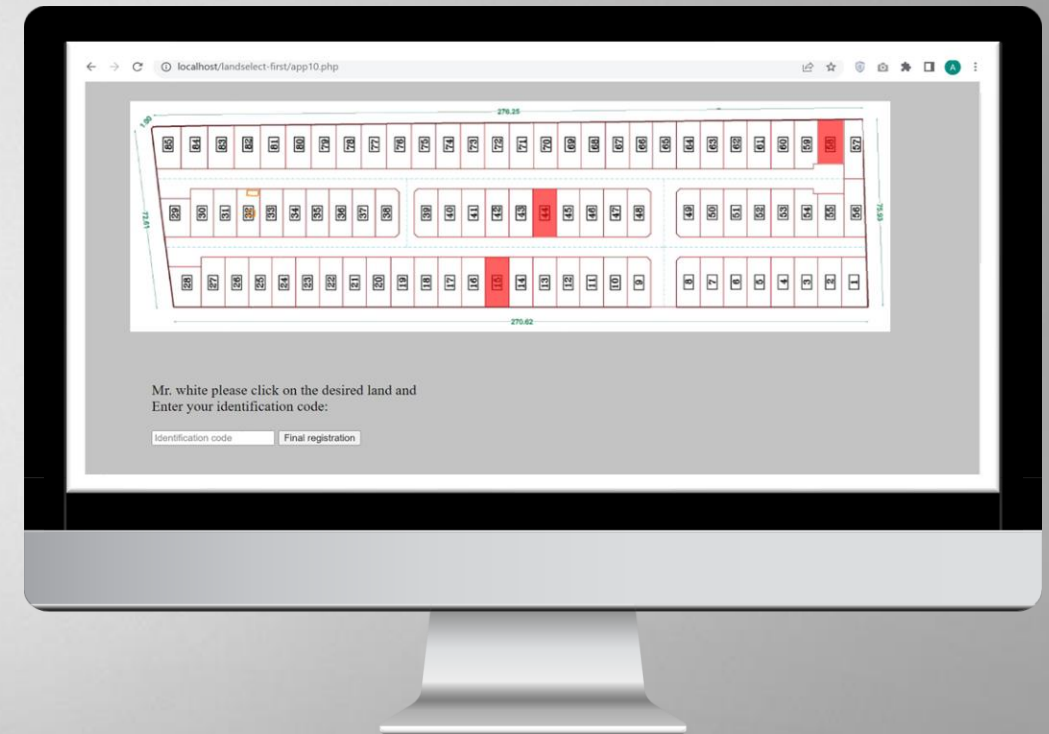

Unprocessed image of the plot of land

Considering that the number of deposits per person was high, I wrote a program that was receiving the amount and date of each deposit multiplied the number of days past the deposit by the amount, and then recorded it as one of that person's points.

Then it would add up all the points of each person and whoever had more points could choose earlier.

After each person selected and recorded the land they wanted, its color would turn red and no one else could choose it.

In the implementation of this project, only PHP programming language was used, and considering that I did the zero to hundred design and development myself, it took about 3 weeks.

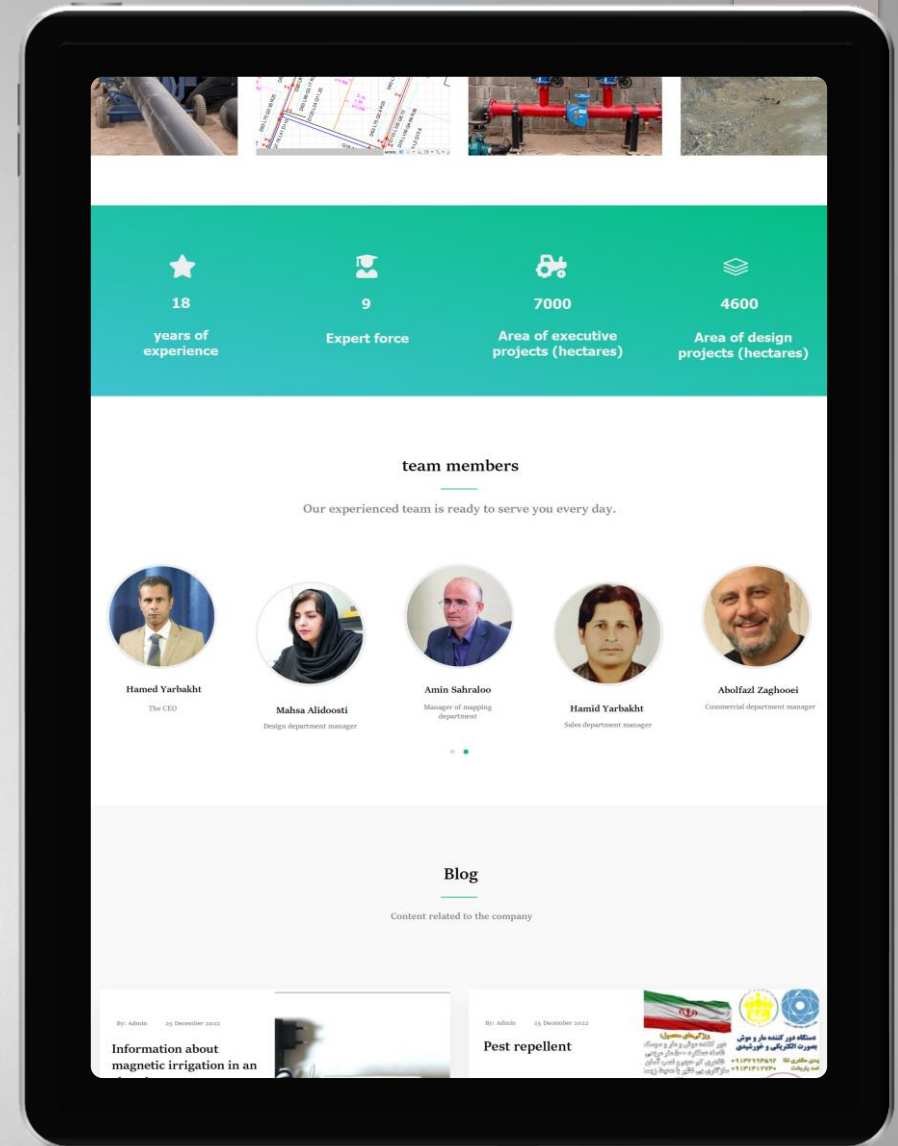

The final design

2. Corporate website:

Business introduction website with a blog section for a private company:

A company was looking for a website to introduce its business and a blog section to introduce its products and services.

In the design of this project, I used WordPress, checked the client's needs and goals. and according to them, showed them some templates. After the desired template was selected, started personalizing it.

Duration of the project: 2 weeks

Part of the project output

Why entrust me with building your website?

Money back guarantee

After the project is delivered to you, you can change your mind up to 7 days later and cancel the deal and get 95% of the money back quickly.

low cost

Even though I have expertise in my job, I am looking for a collection of portfolios and willing to do your project at a very low cost at the beginning of my career.

Trial cooperation

To win your trust, I can do half of your project for free, and if you will want to cooperate, you can pay the cost of the project.
